

1. The points on the  $xy$  plane is maintained at potential  $V_0 \sin(\alpha x + \beta)$ . The potential goes to 0 as  $z \rightarrow \pm\infty$ . Find the potential at all the points above and below the  $xy$  plane.
2. The points on the  $xy$  plane is maintained at potential  $V_0 \sin(\alpha x + \beta)$ . The potential goes to 0 as  $z \rightarrow \pm\infty$ . Find the potential at all the points above and below the  $xy$  plane.
3. A conducting sphere of radius  $R$  has an amount of charge  $Q$  over it. This sphere is placed in an otherwise uniform electric field  $\vec{E}_0$ . The potential of the sphere is found to be  $V_0$ . Find the potential in the region outside the sphere.
4. A sphere of radius  $R$  has a surface charge given by the surface charge density  $\sigma = k \cos 3\theta$  where  $k$  is a constant. Find the potential inside and outside the sphere.
5. A ring of radius  $R$  has a charge  $Q$  uniformly spread along it. The ring is placed on the  $x$ - $y$  plane with the  $z$ -axis coinciding with its axis. Find the potential  $V(r, \theta)$  in the region surrounding the ring.

6. Solve Laplace's equation by separation of variables in cylindrical co-ordinates, assuming there is no dependence on  $z$ .
